Mastodon Comments in Bookstack

There are several people online who have written JS scripts to turn a Mastodon thread into a comment thread on a website. The ones I came across did not directly work with Bookstack however. This is a quick guide for doing the same with Bookstack, although there are surely better ways, this was very quick to setup.

“ Want to see what it looks like first? Just scroll to the bottom, it's on this page!

Based on this Repo: <https://github.com/dpecos/mastodon-comments>

In Bookstack go to **Settings > Customization**

Add the following into the **Custom HTML Head Content** section:

Custom HTML Head Content

```
<script src="https://cdnjs.cloudflare.com/ajax/libs/dompurify/2.4.1/purify.min.js"
integrity="sha512-
uH0KtSfJWScGmyyFr202+efpDx2nhwHU2v7MVeptzZoiC7bdF6Ny/CmZhN2AwIK1oCFiVQ05DA/L9FSzyPNu6Q=="
crossorigin="anonymous" referrerpolicy="no-referrer"></script>
<link rel="stylesheet" href="https://cdnjs.cloudflare.com/ajax/libs/font-
awesome/4.7.0/css/font-awesome.min.css">

<!-- Convert Mastodon Toot link into comment form: https://github.com/dpecos/mastodon-
comments -->
<!-- This is needed b/c Bookstack doesn't allow custom tags like "mastodon-comments"
directly in the page -->
<!-- Recommended link format: <a class="mastodon-link"
href="https://hostux.social/@JaggedJax/T00T_ID" target="_blank" rel="noopener">Leave a
Comment</a> -->
<script>
  const styles = `

}, options);

observer.observe(element);
}
}

function convertMastodonLink() {
  return new Promise((resolve, reject) => {
    // Find the anchor tag with class "mastodon-link"
    const mastodonLink = document.querySelector('a.mastodon-link');

    if (!mastodonLink) {
      reject('No anchor tag with class "mastodon-link" found');
    }

    // Get the href attribute
    const href = mastodonLink.href;

    if (!href) {
      reject('Mastodon link has no href attribute');
    }

    try {
      // Parse the URL to extract host and tootId
      const url = new URL(href);
      const host = url.hostname;

      // Extract tootId from pathname (assuming format like /@user/123456789)
      const pathParts = url.pathname.split('/');
      const tootId = pathParts[pathParts.length - 1];
    }
  });
}

```

```

// Extract username (assuming format like /@username/tootId)
let user = '';
const userIndex = pathParts.findIndex(part => part.startsWith('@'));
if (userIndex !== -1) {
    user = pathParts[userIndex].substring(1); // Remove the @ symbol
}

// Validate that we have the required data
if (!host || !user || !tootId || isNaN(tootId)) {
    reject('Could not parse host, user, or tootId from URL:', href);
}

// Create the new mastodon-comments element
const mastodonComments = document.createElement('mastodon-comments');
mastodonComments.setAttribute('host', host);
mastodonComments.setAttribute('user', user);
mastodonComments.setAttribute('tootId', tootId);
mastodonComments.setAttribute('style', 'width: 840px');

// Replace the original anchor tag with the new element
mastodonLink.parentNode.replaceChild(mastodonComments, mastodonLink);

console.log(`Successfully converted mastodon link to mastodon-comments
element`);
console.log(`Host: ${host}, User: ${user}, TootId: ${tootId}`);

    resolve();

} catch (error) {
    console.error('Error parsing Mastodon URL:', error);
    reject(error);
}
});
}

function loadMastodonScript() {
    return new Promise((resolve, reject) => {
        customElements.define("mastodon-comments", MastodonComments);
    });
}

```

```

}

// Execute conversion first, then load MastodonComments
document.addEventListener('DOMContentLoaded', async () => {
  try {
    await convertMastodonLink();
    console.log('Mastodon conversion complete, loading MastodonComments');
    await loadMastodonScript();
    console.log('MastodonComments loaded successfully');
  } catch (error) {
    console.warn('Unable to load MastodonComments:', error);
  }
});
</script>

```

Now on the page you want to add comments, add the following **<a>** tag where you want the comments to load. Fill in the link to your post on your home server:

```

<a class="mastodon-link" href="https://hostux.social/@JaggedJax/T00T_ID" target="_blank"
rel="noopener">Leave a Comment</a>

```

Note: You need to click the **<>** icon in the Bookstack WYSIWYG editor to paste in this link there. The WYSIWYG does not let you set a custom class that we're using to convert this link. Users without Javascript will just see the link to you post.

How It Works:

The mastodon-comments script is looking for a custom HTML tag which Bookstack doesn't allow. This script instead looks for an **<a>** tag with the class mastodon-link, and converts that into the necessary mastodon-comments tag. This gives the advantage of working well without JS enabled as well.

If no valid **<a>** tag is found then the mastodon-comments script is not triggered.

Improvements:

- The JS here could be cleaned up a lot. Much of the CSS is unused, and the use of a Promise is overkill here. That's leftover from my initial attempts and is not necessary.
- Font Awesome is being used to show icons. It would be nice to remove that
- The mastodon-comments script this is taken from uses DOMPurify to help prevent XSS. That's a great thing, but we could just embed the code locally to avoid the callout.
- If you make your own improvements please comment and let me know so I can make them too!

Zed

Zed is the hot new editor, in the style of VS Code, but from scratch. Here are some setup recommendations based on my experience.

PHP

Extensions

If using PHP, install the PHP extension. If you open a PHP project file then Zed should automatically suggest installing it for you,

Language Server

Zed uses the Phpactor language server by default. While I love its Open Source nature, it does not yet have the level of performance necessary for most projects. Mago is another promising new LSP to watch out for, but for now we have to stick with intelephense to get work done.

1. Open Settings > Edit in settings.json
2. Add this `language_servers` line under the PHP languages section, or att the entire section if it's not there yet.

```
{
  "languages": {
    "PHP": {
      "language_servers": ["intelephense", "!phpactor", "..."],
      "hard_tabs": true,
    },
  }
}
```

OPTIONAL: To save memory you can also add `!phptools` to that list so the Devsense LS isn't loaded either. Or can use it instead of intelephense.

Restart Zed and it should automatically download and switch to intelephense.

Built-in Webserver

To enable easy running of the PHP Built-in webserver:

1. Run > Edit Tasks.json
2. Add this inner record. Replace `/src/web` with the path to your index or router directory, or remove if not necessary. The `$ZED_WORKTREE_ROOT` ensures this always starts from your project root dir.

```
[
  {
    "label": "PHP: Bult-in Webserver",
    "command": "php -S 127.0.0.1:8000 -t $ZED_WORKTREE_ROOT/src/web",
    "use_new_terminal": false,
    "allow_concurrent_runs": false,
    "reveal": "always"
  }
]
```

Launch by going to Run > Spawn Task
